

CSCI 4200: Operating System Engineering

Lab Exercise 4: Revising tty.c to Clear the Console

Due Date: March 22, 2026, 23:55

In this lab, you will extend `tty.c` (provided in) by implementing a console clearing function. The goal is to reset the console to its initial state whenever the user inputs **Ctrl + c**.

Important note: A helper function **`clear()`** has already been implemented in **`console.c`**. You may call this function directly to perform the clearing operation.

Requirements:

- Detect the key combination **Ctrl + c** in `tty.c`.
- Invoke `clear()` from `console.c` when this input is received.
- Ensure the console is restored to the same initial state as at program startup.

What to submit:

- You only need to submit the revised `tty.c` file.
